1. Repository creation

The first thing we are doing is creating the respository. For this we have to log in our GitHub account, give a name for our respository and press the "Create a new repository" button (As we can see in the *Illustration 1*).

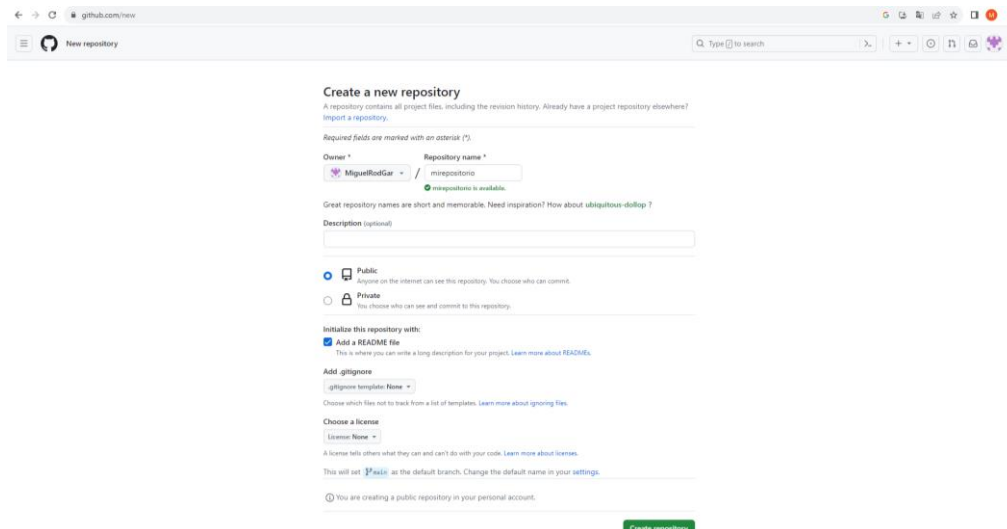

Image 1

2. Page creation

Next, we need to add the 'index.html' file. We can create it directly on GitHub or upload the file from our computer.

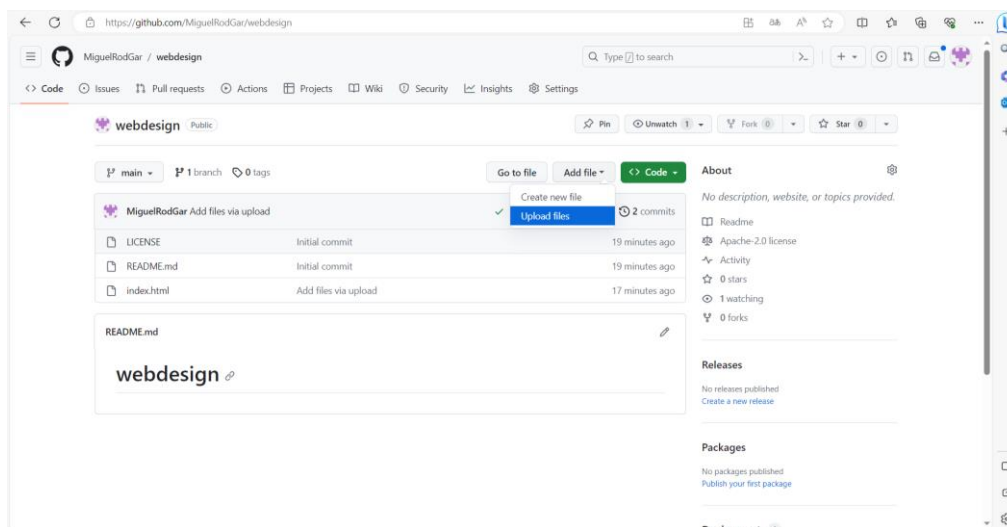

Image 2

Now, let's go to 'Settings,' to the 'Pages' section, and select 'main' as the Branch. Afterward, refresh the page, and the link to our site will appear at the top (Image 3).

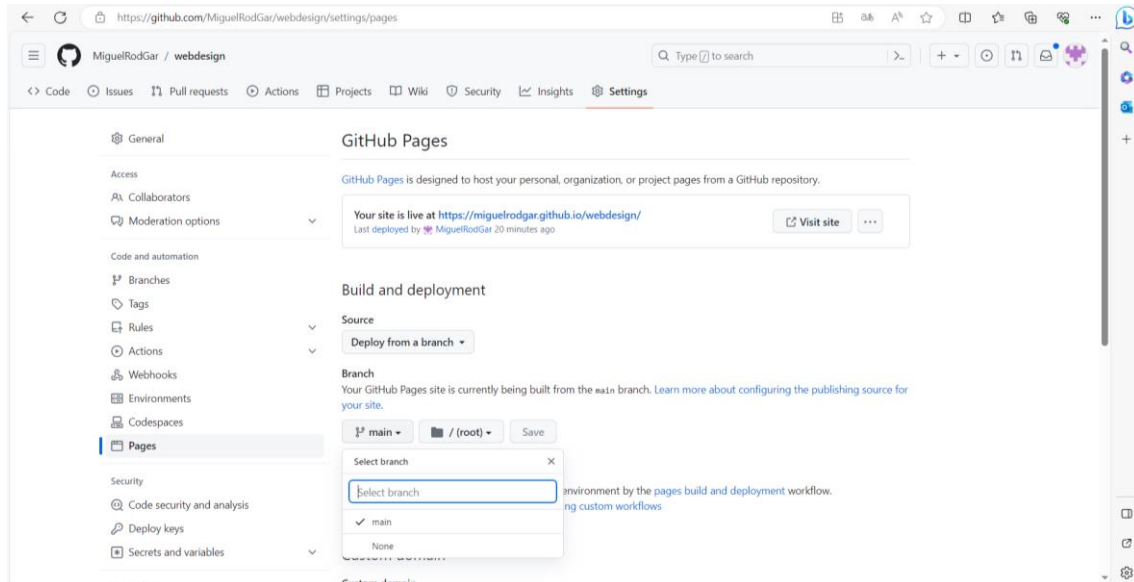

Image 3

At this moment the page is created and functional as we can see in Image 4.
